

It goes without saying that police and corrections officers work in hazardous environments with significant potential for injury. Whether the threat be ballistic, stab, blunt trauma or even related to vehicle crash safety, Biokinetics and Associates Ltd. is available to help understand the risks. Our engineers and scientists have studied injury causation and prevention and we are equipped with dedicated laboratory facilities to support this work.

We can't protect our officers without first understanding the threats, and in a biomechanics sense that means quantifying the threat energy and relating that to a human's tolerance to injury. Only then can we develop better protection products and injury prevention strategies. If you need to better understand the injury threat to your officers, please give us a call.
